**Abstract**

Usually, our institute receives requests for evaluating the quality of waste, including hazardous character establishing, in order to assign the code, to establish the category of deposit that can be accepted, for transport etc. This type of request is solved by applying a methodology developed in the institute (in the absence of rules implementing Law 211/2011 on waste regime and the Government Decision no. 856/2002 on waste management records and approving the list of wastes, including hazardous waste). At the basis of quality assessment of waste sit the information related to the processes and raw and auxiliary materials that are related to the generation of waste and the results of analytical determinations can be made for that waste. However, the evaluation analysis collides with the different types of problems that require specific ways of solving. The paper shows the types of problems encountered in practice for evaluating the quality of waste and ways of solving these problems.
