

<b>Program</b>	<b>Program Nucleu, contract 20N/2019, project code: PN 19-04 02 01</b>
<b>Project title (ENG):</b>	Biological models and molecular biomarkers for assessing the toxic potential of water resources affected by anthropogenic pollution - SMARTWAY
<b>Project title (RO):</b>	<i>Modele biologice si biomarkeri moleculari pentru evaluarea potentialului toxic al resurselor de apa afectate de poluarea antropica - SMARTWAY</i>
<b>Duration</b>	2019 -2022
<b>Team Leader</b>	Dr. biol. Alina Roxana Banciu
<b>Summary</b> (short description) ENG	<p>The project addresses a topical issue at national and European level regarding the uncontrolled use of antibiotics and biocides and the toxic effects generated by them on the aquatic environment. The main goal is the development of experimental models using aquatic organisms and molecular biomarkers to evaluate the quality conditions of the aquatic environment and to predict the toxic potential.</p> <p>The realization of this project between 2019-2022 and the development / implementation of a molecular microchip is a national premiere. In addition, the implementation in the laboratory practice supports environmental protection agencies by monitoring and predicting the pollution generated by anthropogenic factors and at the same time favours the establishment of a national and international scientific networking specific to the field addressed.</p> <p>In 2019, starting from the objective of deepening the evidence of genetic determinism of the mechanisms of bacterial resistance to antibiotics, quantitative and qualitative studies were carried out on wastewater samples from two connections of an emergency medical unit in Bucharest and on samples from surface water and sediment taken from the natural settlements initially established, the Teleajen River and the Danube River.</p> <p>Alternative testing methods for assessing the toxic potential of aquatic ecosystems were also addressed. Alternative methods have been tested in parallel with conventional methods, which are based on morphological identification of organisms, using benthic macroinvertebrates.</p>
<b>Summary</b> (short description) RO	<p>Proiectul abordeaza un subiect de actualitate la nivel national si european referitor la utilizarea necontrolata a antibioticelor si biocidelor si la efectele toxice generate de acestea asupra mediului acvatic. Obiectivul general al proiectului este reprezentat de dezvoltarea unor modele experimentale utilizand organisme acvatice si biomarkeri moleculari pentru evaluarea conditiilor de calitate a mediului acvatic si predictia potentialului toxic.</p> <p>Realizarea acestui proiect in perioada 2019-2022 si dezvoltarea/ implementarea unui microcip molecular constituie o premiera la</p>

	<p>nivel national. De asemenea, implementarea in practica laboratorului vine in sprijinul agentilor de protectia mediului prin monitorizarea si predictia poluarii generate de factori antropici si totodata favorizeaza stabilirea unui networking stiintific national si international specific domeniului abordat.</p> <p>In 2019, pornind de la obiectivul de a aprofunda evidențierea determinismului genetic al mecanismelor de rezistență bacteriană la antibiotice, s-au efectuat studii cantitative și calitative pe probe de apă uzată provenită din două raccorduri ale unei unități medicale de urgență din București și pe probe de apă de suprafață și sediment prelevate din emisarii naturali stabiliți initial, raul Teleajen și Fluviul Dunărea.</p> <p>De asemenea, au fost abordate, metode de testare alternative pentru evaluarea potențialului toxic al ecosistemelor acvatice. Metodele alternative au fost testate în paralel cu metodele conventionale, cele care au la bază identificarea morfologică a organismelor, utilizându-se macronevertebratele bentonice.</p>
<b>Dissemination of results</b>
